# Experian Auto Intelligence Cloud

Turning automotive data into a governed inventory & risk product on Databricks

databricks

# Insight arrives too late to price the car

# Every extra day on the lot, every mispriced loan, is margin lost

- Used vehicles that sit too long bleed gross profit — carrying cost, depreciation, floorplan interest
- Lenders misprice risk when vehicle condition and local demand never reach the credit decision
- Experian VIO, AutoCheck & lending data reach 90%+ of franchise dealers and top-50 lenders — yet ship as flat files customers must move, model and maintain
- The result: static reports, disconnected from the acquire / price / lend decision

# The outcome, first

## Turn inventory faster

Predict days-to-turn and price each unit to a target turn speed

## Price risk sharper

Condition- and demand-adjusted default risk, inside the credit decision

## Sell data as a product

Live, governed data + AI — not flat files customers must maintain

# Quantified impact (illustrative)

## Domain owner — inventory & pricing

Days-to-turn predicted within ~4 days

Residual value predicted within ~$932

~5–7 fewer days on lot per unit → ~10–15% faster turns

## Executive sponsor — P&L & growth

Default risk ranked at AUC 0.90

25–50 bps of avoided loss on a $1B portfolio ≈ $2.5–5M / yr

New revenue: data → +Genie → +App tiers

# The solution: Inventory & Risk Co-Pilot

- Acquire — which used vehicles to buy, at what price, for local demand (VIO + AutoCheck)
- Price & Risk — condition-adjusted residual value and default risk on any VIN (AutoCheck + Credit)
- Market Radar — where loan & lease share is shifting and which segments are underserved
- Ask (Genie) — a natural-language analyst for anything ad hoc, with the SQL shown

# One platform, six integrated stages

## Ingest & prep

Lakeflow / Visual Prep lands and fuses VIO, AutoCheck and lending into gold products

## Govern & serve

Unity Catalog governs every field; Lakebase Postgres serves sub-ms VIN lookups

## Make it intelligent

Mosaic AI models + Genie NL, surfaced in the Co-Pilot Databricks App

# It's real — live, not a mockup

## Built & running today

20,000 VINs served from Lakebase — 0.08 ms indexed lookup

3 models live on Model Serving

Genie answers in plain English with generated SQL

App live: VIN lookup served_by = lakebase

## Model & data quality

Default-risk model AUC 0.90

Days-to-turn MAE ~4 days

Residual value MAE ~$932

54,320 governed gold rows across 3 datasets

# From files to a living product

## Today — files & portals

SFTP extracts, static portals

An analyst builds every report

Days-to-weeks time-to-value

Flat subscription

## Auto Intelligence Cloud

Live Delta Sharing, no copies

Genie NL answers + an AI app

Minutes, self-serve

Tiered: data → +Genie → +App

# Get there in 4–6 weeks

- Weeks 1–2 — land sample data; build 3 Visual Prep gold pipelines in Unity Catalog
- Weeks 2–3 — Delta Share to a customer workspace; Genie space answering 10 golden questions
- Weeks 3–5 — residual / days-to-turn / default models; Co-Pilot app + Lakebase serving
- Weeks 5–6 — per-customer entitlements; executive demo and monetization story

# Move from selling files to selling intelligence

databricks
